

$c_m = 0 \;\Rightarrow\; g_m = 1 \;\Rightarrow$ ordinary late fusion $\beta_{\text{tab}} z_{\text{tab}} + \beta_{\text{img}} z_{\text{img}}$

fit: Efron Cox loss $+ \lambda \|C\|^2$, L-BFGS, 6 parameters (β: 2, C: 2×2)

$\lambda \in \{0.01, 0.1, 1, 10, 100\}$ by inner 4-fold CV; large λ switches the gate off

$z_m = (r_m - \mu_m)/\sigma_m$, with μ_m, σ_m from training patients only
