Table 5. Survival According to the Risk Group Defined by the Proposed Model

Endpoint	Risk group	Patients	Events	Median, months (95% CI)	1-year rate, %	2-year rate, %	HR (95% CI)	*P*
OS	Low risk	112	83	18.9 (15.5–24.3)	67.9	42.7	1 (reference)	< 0.001
	High risk	126	116	7.7 (6.4–9.6)	29.4	12.7	2.32 (1.74–3.10)	
PFS	Low risk	122	101	8.5 (6.6–10.1)	34.4	20.2	1 (reference)	< 0.001
	High risk	116	111	5.2 (4.7–5.6)	10.3	5.9	2.03 (1.54–2.67)	

High risk, risk score above the median of the training patients of each fold; the five test folds were pooled (not an independent test set). *P*, log-rank test; HR, Cox model. CI = confidence interval, HR = hazard ratio, OS = overall survival, PFS = progression-free survival
